APPENDIX 201

CHAPTER 1 INTRODUCTION

The following is a report on Edmonton demography based on the 1987 Civic Census and on recent revisions relating to Edmonton's natural increase. As a response to public and interdepartmental inquiries, the format of the report was chosen to provide Census information at as fine a level of detail as possible.

This report is divided into five chapters which provide a comprehensive overview of Edmonton demography. The present chapter will review briefly the report and the context within which it appears. Chapter 2 is a report from the 1987 Civic Census, providing a detailed demographic picture of small areas (Census Enumeration Areas) within the city. Chapter 3 is a demographic report on larger areas (Census Tracts) within the city. Chapter 4 reviews recent trends in Edmonton demography and Chapter 5 provides two detailed citywide forecasts of population by 5-year age groups and sex. The forecasts are closely related to the city forecasts presented in this report for 1986.

The Edmonton Civic Census, conducted usually each Spring, provides information on the age, sex, marital status, residency status and certain occupational distribution of Edmonton residents, as well as details on the distribution of households and dwelling units throughout the City.

The city's population was enumerated at 576,249 persons, 285,049 male and 291,200 female, as at April 1, 1987. The number of enumerated households (all occupied dwelling units, rented or owned) was at 227,852. Of that figure 118,472 dwelling units were rented and 109,380 units were owned. Full details appear in the tables.

The following review of Edmonton demography is based almost solely on data from the Civic Census. Questions or further queries regarding this report should be made to Avi Akkerman or to Robert Higgins at 428-3571.

CHAPTER 2 POPULATION AND HOUSEHOLDS IN CENSUS ENUMERATION AREAS

The geographic area of the City of Edmonton has been divided into 638 Census Enumeration Areas (CEA) for purposes of the Civic Census of 1987. Table 1 lists all Edmonton Census Enumeration Areas. For purposes of this report, each CEA has been assigned a serial number from 1 to 638. These numbers serve as further reference in the Tables that follow, and are given in parentheses preceding each CEA name on the list in Table 1. Further, each CEA as listed in Table 1 corresponds to a geographic area delineated on the City map enclosed to this report.

Each of the 638 Census Enumeration Areas belongs to a Census Tract (CT). A CT name has the structure nN.nn where N is always a digit; n is either a digit or a blank. A Census Enumeration Area name is composed of the name of the census tract to which it belongs with a serial number s appended at the end of the name. Thus, CEA name structure is: nN.nn s. The sequence '.00' in CEA name in Table 1 indicates that there are blanks in the corresponding CEA name on the map. The number s is a unique identification of each CEA indicating its sequence within the Census Tract.

The population age distribution and numbers of households for each CEA are given in Table 2. The TOTAL at the bottom of Table 2 indicates the population age distribution and the number of households in the City of Edmonton at mid-year 1987.

The population distribution by occupational category for each CEA is provided in Table 3. There are 12 mutually exclusive categories enumerated by the Civic Census for the population occupational distribution:

1. Preschooler
2. Kindergarten - Grade 6
3. Grade 7 - Grade 9
4. Grade 10 - Grade 12
5. Post secondary student
6. Homemaker
7. Employed Full Time
8. Employed Part Time
9. Not employed and looking for work
10. Retired
11. Unable to work
12. Other

The bottom of Table 3 contains the appropriate totals for the whole city.

Residency status and place of origin for each CEA is given in Table 4. Eleven mutually exclusive categories are presented in Table 4, all relating to residency at present address and place of origin:

1. 5 years or more
2. 3-4 years
3. 1-2 years
4. Less than 1 year of age, not considered for residency status
5. Less than 1 year from elsewhere in Edmonton
6. Less than 1 year from elsewhere in Alberta
7. Less than 1 year from Atlantic Canada
8. Less than 1 year from Ontario
9. Less than 1 year from Quebec
10. Less than 1 year from elsewhere in Western Canada
11. Less than 1 year from rest of the world

Distribution of dwellings by type is given in Table 5. The distribution is given as follows:

1. Bachelor suite
2. One-bedroom unit
3. Two-bedroom unit
4. Three-bedroom unit
5. Four-bedroom unit
6. Five or more bedroom
7. Collective residence
8. Hotel
9. Other
10. Rented dwelling
11. Owned dwelling
12. Vacant dwelling
13. Under construction

CHAPTER 3 POPULATION AND HOUSEHOLDS IN CENSUS TRACTS

Table 6 lists all Edmonton Census Tracts. Census Tracts or their conglomerations have been assigned serial numbers from 1 to 149, and the numbers serve as reference in the Tables in this chapter. Each CT or CT conglomeration corresponds to the areas delineated on the enclosed City map.

Table 7 gives the population age distribution and the number of households for each CT.

Table 8, 9 and 10 give the population distribution for Census Tracts by occupational category, marital status and sex, and length of residency and place of origin. Table 11 lists households and dwellings by type, for each of the Census Tracts. All distribution categories are the same for Census Enumeration Areas and Census Tracts, as listed in Chapter 2.

For marital status and sex ten mutually exclusive categories were introduced for Civic Census enumeration and presentation in Table 9.

1. Single male
2. Single female
3. Married male
4. Married female
5. Divorced male
6. Divorced female
7. Widowed male
8. Widowed female
9. Other - male
10. Other - female

CHAPTER 4 TRENDS IN EDMONTON DEMOGRAPHY

A noteworthy feature of Edmonton demography has been the increase in fertility rates. The present rise in Edmonton fertility is consistent with an all-Canadian trend reported in the public media some time ago. Fertility, at least in Canada in the past decades, has been subject to periodic fluctuations. The baby boom after World War II (1945-1955) indicated a rise in fertility rates across Canada, and in Edmonton in particular. The present rise in fertility may echo that baby boom.

Tables 12 to 15 show various fertility indicators for Edmonton in the past decade. The various fertility measures, explained in the Appendix, show consistent increase for Edmonton. Yet, it must be noted that despite the increase in fertility indicators, Edmonton population growth is below replacement level if net-migration is excluded.

The consistent trend in the fertility indicators between 1978 and 1986 may be summed up as follows:

> Total fertility rate (number of children expected to be born to a woman during her life cycle) has risen consistently from 1.63 to 1.78.
>
> Gross reproduction rate (number of baby girls to be born to a woman during her life cycle) has risen from 0.78 to 0.87.
>
> Net reproduction rate (same as GRR but accounts also for the woman's mortality prior to the end of her fertility cycle) has increased from 0.76 to 0.85.

Figures in the "AGE" column in Tables 12-15 and Table 16 are lower bounds of age groups. Thus age 0 indicates age group 0, 1 indicates age group 1-4, 5 indicates age group 5-9, 40 indicates 40-44 etc. Examination of tables 12-15 allows detailed follow-up for each age group throughout the past 10 years, showing a consistent increase in fertility. Changes in the male and female age distribution over the decade can be followed in the life tables (Table 16) as well as in Figures 1-5.

There may be several factors influencing the recent rise in fertility. However, the underlying pattern seems to simply indicate the reproductive behaviour of baby-boom offspring in Edmonton. The demographic trait of persons in later reproductive ages seems to be to postpone marriage and family building until the establishment of their careers.

This may account for the recent rise in fertility in women 30+ and in the overall rise in fertility indicators. Pursuing this speculation further, however, a decline in fertility rates should be expected as female baby boom offspring begin to exit their fertile ages in their late thirties and early forties. This reinforces the past observation that Edmonton fertility rates oscillate (Edmonton Demographic Indicators, 1984, p. 135). Assuming that this, indeed, is the case, it is likely that within the next 5-10 years Edmonton fertility rates will reach their peak. The general trend in some of the fertility indicators can be observed in Figure 6.

Consistent with the increase in fertility, an increase in the life expectancy in Edmonton has been recorded in the past 10 years. Table 16 is extract of life tables for Edmonton. The Table shows population, deaths and life expectancy between 1978 and 1986. The number of persons, PP (males or females), and the number of deaths, DD, from which life expectancy is derived, is recorded for each age group. Life expectancy at age X, E(X), is given usually for 5-year age-groups, showing the expected number of years to end-of-life from the mid-point of the age-interval. Life expectancy at birth has been consistently increasing from 71.7 in 1978 to 73.4 in 1986 for males, and from 79.6 in 1978 to 80.0 in 1986 for females. Figure 7 provides a general overview of life expectancy at birth of the past decade.

CHAPTER 5 POPULATION PROJECTIONS FOR EDMONTON

Consistent with the observed demographic trends, the demographic data base for Edmonton has been recently revised, and is currently still under review. The Edmonton demographic data base constitutes the information input into the population projections done periodically by the Planning and Building Department.

Up to 1986 the demographic data base in use consisted of demographic measures for 1983, except for the current age distribution for males and females. Consistent with the brief review presented in Chapter 4, revisions have been made to Edmonton birth rates. Minor adjustments from the 1983 measures were made for survival rates, based on recently published data from the Alberta Bureau of Statistics. A detailed description of the birth-rate estimating procedure is forthcoming in Research Paper No. 21 of the Corporate Forecasting Group (Planning and Building Department, 1988). The resulting data base for 1987 is provided in Table 17. Figure 8 shows overall comparison between birth rates in the 1986 and the 1987 data bases.

Table 18 is a population forecast for Edmonton, 1987 to 2002. The forecast is based on the 1987 census population distribution and vital rates presented in the demographic data base in Table 17.

Migration assumptions in the forecast are identical to those presented in 1986 and appear in detail for each of the forecast years. For comparison purposes, the official forecast of 1986 is presented in Table 19. The estimated number of births and deaths appears, as well, for each of the forecast years.

The overall feature of the forecast indicates significant increase in old-age groups and gradual, slight increase in the number of children between now and 2002. As discussed already in the previous chapter, Edmonton natural increase is below replacement level, even with the rise in fertility. This is confirmed again by the forecast of crude birth rate which shows a decline from 18 to 13 per thousand population. Comparison between the two forecasts for age groups 0-4 and 5-9 is given in Figure 9.

The reader should be aware that the presented forecasts are the result of several assumptions, believed to be the most credible at the time of the projection. These assumptions may, or may not, take actual effect. The degree of accuracy of the presented forecasts reflects, therefore, the closeness of the assumptions to the demographic reality of Edmonton. The Planning and Building Department will continue to report on future developments in Edmonton demography.

APPENDIX

Sex-age-specific birth-rate: Average number of live female births occurring in 1 year to a woman in age group (x, x + 4).

Total fertility rate (TFR): The sum total of the age-specific birth rates over all fertile ages. The TFR is a gross measure of the average number of children to be born to a woman throughout her life cycle. This measure does not account for the woman's mortality throughout or prior to childbearing ages.

Gross reproduction rate (GRR): The sum total of sex-age-specific birth rates over all fertile ages. The GRR is a crude measure of the average number of females to be born to a female throughout her life cycle. Similar to TFR, GRR does not account for the female's exposure to mortality throughout or prior to childbearing ages.

Net maternity function: The expected number of female births that will occur to a newborn female during specified age interval, accounting for her mortality exposure prior to reaching that age interval.

Net reproduction rate (NRR): The sum total of values obtained for the net maternity function for all age-groups. NRR is thus the expected number of females to which a newborn female will give birth during her life cycle. It is, therefore, a replacement ratio for newborn females, under given regime of mortality and fertility. If the regime remains fixed, the NRR gives, in the limit, the population ratio between successive generations of females.

Length of generation: The time in which the population, in the limit, increases by the ratio of NRR.

Intrinsic rate: The population natural increase rate, in the limit.
